

- Port – This is the port the LDAP Connection will use to communicate with the Domain Server. If you have a secure connection, use port 636. Else, as we are doing, use port 389
  - Bind Username – This is the AD/Domain userid who has access rights to JOIN images, pcs, etc. to the Domain Server.
  - Bind Password – This is the aforementioned userid's password
  - UPN Suffix – The Principal Name for the Domain
  - Base DN - Is the point from where a server will search for users
  - User Secure Connections – Check this if you are using port 636. If you are using port 389, uncheck this box.
- Pressing SAVE, with the Validate LDAP Server checked, the connection is verified.

- Given the previous screen shot, here's a screen shot of my Domain/AD:

- As you can see, I have defined an Organizational Unit (OU) entitled VERDEPC ... I have a user entitled Robin Purviance all in my Domain “hadrian.net”.
- Given my Domain setup, let’s access the MC and define our AD connection.
- Go to MC/Configuration/Sessions Setting and press the CREATE NEW button up the upper right of the screen.
- Provide a name. My name is AD2048NAT... Active Directory, 2048 RAM, NAT’d networking.
  - Desktop Name Prefix - Type in a simple naming convention for your images (don’t exceed 5 characters) in the Desktop Name Prefix. The images that use this Session Setting will all contain this prefix in the name. This makes it much easier to identify images in the LiveSessions list of sessions.
  - AD Domain Name FQDN – This is the actual Domain Name
  - OPTIONAL\*\* AD Organizational Unit (OU) – This allows for a faster search through the Domain OU. Take note to the order this is written. The furthest point down the Domain tree is stipulated first (OU=VERDEPC). If there was a higher level, it would be next (OU=SECONDlevel). Finally, the Domain Name (DC=hadrian,DC=net)

- AD Administrator Username – This is the AD/Domain user who has access rights to join an image, pc, etc. to the Domain. Usually, this will be the same userid used in the LDAP Connections configuration.
- AD Administrator Password – The aforementioned userid's password
- Confirm AD Administrator Password – Confirmation of the previous password.

**Create new Session Settings Object**

**Description:**

SYSTEM	NETWORK	PROTOCOL	ACTIVE DIRECTORY
<b>SETTINGS</b>		<b>VALUE</b>	
Desktop Name Prefix		<input type="text" value="ROBI"/>	
AD Domain Name FQDN		<input type="text" value="hadrian.net"/>	
Optional: AD Organizational Unit (OU), ex: OU=test,DC=example,DC=com		<input type="text" value="OU=VERDEPC,DC=hadrian"/>	
AD Administrator Username (UPN)		<input type="text" value="Administrator@hadrian.net"/>	
AD Administrator Password		<input type="password" value=""/>	
Confirm AD Administrator Password		<input type="password" value=""/>	

- Press the SAVE button. This does not ensure your settings are correct. Only the LDAP connection is verified at the time of its creation.

- Now we can assign our image to our AD user. The ID I'm using that was in the Domain Users is "Robin". To assign, once again, let's go to Desktop Policy
- MC/Configuration/Desktop Policy
- Press the ADD RULE button
- I have filled it with the name robin@verdetest (verdetest is the name of my LDAP connection)
- Selected my Gold Image and Selected my AD2048NAT SessionSetting

**Desktop Policy**

Use this table to determine which Gold Images and Desktop Pools will be accessible by which users. You may enter multiple values in the User/Group column, separated by commas (e.g. "b

RULE	USER / GROUP	IMAGE / POOL
1	Administrator	server
1	%localverde	Win101909 (
		Win732 (glob
2	robin	win764
3	robinourv@verdeldap	Win732 (glob
	All Users	None

**+ Add Rule**

\*User/Group:  \*Indicates required field  
Precede group names with "%".
